

Every one of the 15,000 scenario evaluations receives a certified statement, and the certified interval contains the exact value in 15,000 of 15,000 cases. The panels plot the 7,947 evaluations where a Chernoff bound does the work; the remaining 7,053 are exact by construction (the threshold is at or beyond the support, so the probability is 0 or 1 and no bound is needed) and would sit on the diagonal's endpoints. The one-sided bound alone covers only the left panel.
